Flood Wall Design. Good Flood wall design is important. There are temporary flood protection walls that can be constructed during a flood as the flood water begins to rise. And there are permeant flood protection walls in areas that have a high risk of flooding. The design principles are much the same as we are dealing with basic physics.

Gravity walls rely on the mass of the wall to resist the forces that are trying to push it over, slide it, and overturn it. Walls are normally designed to a factor of safety of 1.5. This means there is 1.5 times the mass than the forces trying to push it over. Reinforced earth walls are different. Geo mat is used to create a mass of earth that becomes the structural element of the retaining wall.
