A Punnett square consists of a table listing all of the possible genotypes for offspring. This is dependent upon the genotypes of the parents being studied. The genotypes of these parents are typically denoted on the outside of the Punnett square.

Genetics: Punnett Squares and Incomplete vs Codominance Most genetic traits have a stronger, dominant allele and a weaker, recessive allele. In an individual with a heterozygous genotype, the dominant allele shows up in the offspring and the recessive allele gets covered up and doesn't show; we call this complete dominance.

Study the parents' genetics. There are children with cystic fibrosis in both of families. Both parents are healthy, but they still may be carries since the disorder is inherited in an autosomal recessive manner. Fill in the square! We need two Punnett squares for this particular case. A - Healthy, dominant allele; a - Recessive allele of Cystic ...

Punnett Square Calculator - Traits and Genes Calculator

It is possible to generate Punnett squares for more than two traits, but they are difficult to draw and interpret. A Punnett Square for a tetrahybrid cross contains 256 boxes with 16 phenotypes and 81 genotypes. A third allele for any one of the traits increases the number of genotypes from 81 to 108. Given this complexity, Punnett Squares are not the best method for calculating genotype and phenotype ratios for crosses involving more than one trait. Test your understanding with the Punnett ...
