The first book dedicated to this new and powerful computational method begins with a comprehensive description of MCTDH and its theoretical background. There then follows a discussion of recent extensions of MCTDH, such as the treatment of identical particles, leading to the MCTDHF and MCTDHB methods for fermions and bosons. The third section presents a wide spectrum of very different applications to reflect the large diversity of problems that can be

tackled by MCTDH. The result is handbook and ready reference for theoretical chemists, physicists, chemists, graduate students, lecturers and software producers.

This volume is about automation - automation in design, automation in manufacturing, and automation in production. Automation is essential for increased productivity of quality products at reduced costs. That even partial or piecemeal automation of a production facility can deliver dramatic improvements in productivity has been amply demonstrated in many a real-life situation. Hence, currently, great efforts are being devoted to research and development of general as well special methodologies of and tools for automation. This volume reports on some of these methodologies and tools. In general terms, methodologies for automation can be divided into

two groups. There are situations where a process, whether open-loop or closed-loop, is fairly clearly understood. In such a situation, it is possible to create a mathematical model and to prescribe a mathematical procedure to optimize the output. If such mathematical models and procedures are computationally tractable, we call the corresponding automation - algorithmic or parametric programming. There is, however, a second set of situations which include processes that are not well understood and the available mathematical models are only approximate and discrete. While there are others for which mathematical procedures are so complex and disjoint that they are computationally intractable. These are the situations for which heuristics are quite suitable for automation. We choose to call such automation, knowledge-based automation or heuristic programming.

This practical surgical atlas focuses on a variety of surgical procedures in a portable format, allowing students, residents and even attending surgeons to carry it around with them throughout the day to check up on operations at any given time. The comprehensive illustrations help the reader to understand the procedures described, thanks to inter-operative photographs which provide accurate representations of the various techniques of the operations. The wide scope of this book ensures coverage of the most common general surgery procedures and the most common operations that faculty, residents and students encounter.

Now in its fifth edition, the book has been updated to include more detailed descriptions of new or more commonly used techniques

since the last edition as well as remove those that are no longer used, procedures which have been developed recently, ionization constants (pK_a values) and also more detail about the trivial names of compounds. In addition to having two general chapters on purification procedures, this book provides details of the physical properties and purification procedures, taken from literature, of a very extensive number of organic, inorganic and biochemical compounds which are commercially available. This is the only complete source that covers the purification of laboratory chemicals that are commercially available in this manner and format. *

Complete update of this valuable, well-known reference * Provides purification procedures of commercially available chemicals and biochemicals * Includes an extremely useful compilation of ionisation constants
