I found it very hard. I did lots of work for
M3 and was getting about 90-95 ums on
past papers. I'll be happy with 80 on that
paper. The style of questions were
different and the scenarios were unlike
previous examples in past papers. I
probably could have answered the
majority of questions if I wasn't so
pressured for time.

This is the second volume in a series of critical reviews of the chemical thermodynamic data of those elements of particular importance in the safety assessment modeling of high-level radioactive waste storage and disposal facilities. The objective of these reviews is to provide a set of reliable thermodynamic data that can be used to describe the behaviour of these elements under conditions relevant for radioactive waste disposal systems and the geochemical environments. The present volume is a review of experimental data reported in the literature for americium. On a few occasions, where no data existed, comparisons and estimates were made based on experimental data on analog lanthanide elements. The basic philosophy was to develop a minimum set of solid
