The New York-based startup pairs stay-at-home parents with those needing child care to offer a solution to the pandemic-accelerated dearth of options.

Otter Raises \$23 Million To Tackle Broken Childcare Market And Help Stay-At-Home Parents Get Paid

Caroline, the site's editor, was nice enough to indulge me and deal with my incredible wordy questions and answers ... both games of the two-game sweep, UT had impressive performances from ...

Non-Destructive Testing (NDT) is an activity closely related to the quality and reliability of products, and to the reliable and safe operation of industrial plants. Physical measuring techniques are used to examine parts of constructional assemblies for hidden imperfections and defects. A wide choice of measuring techniques is available to meet the demand of examining a wide variety of materials such as metals, plastics, rocks, as well as different structures and sizes ranging from semiconductor chips to nuclear reactors and off-shore oil platforms. Activities in the field of NDT encompass: Fundamental research to understand and describe the way in which reactions of certain imperfections to a physical measuring technique can be optimized and used to assess type and grade of imperfection; Methods to characterize materials and materials properties;

Applications in product quality control; Applications in plant inspection to ensure a reliable operation of components, avoiding damage to both man and environment, as well as financial losses; Personnel education and qualification schemes; The spread of NDT applications to newly industrialized countries. The two proceedings volumes contain over 400 review and specialist papers. The most recent developments in the field of NDT are presented with contributions by outstanding experts from all over the world. Papers are grouped according to technique for those dealing with fundamental research and to field of application for the more practical oriented ones. In this way each chapter provides an easy overview of related current research. Extensive keyword indexes have been included to facilitate the retrieval of information according to individual requirements. The high technical level of the papers and their up-to-date content will make them an indispensable source of information for students, researchers and professionals in the areas covered.

The amendments of this third English edition with respect to the second one concern beside some printing errors the replacement of some pictures in part D by more modern ones and updating the list of stand ards to the state of the fourth German edition. JOSEF KRAUTKRÄMER Cologne, January 1983 Preface to the Second Edition This second English edition is based on the third German edition. In view of most recent

technological advances it has become necessary in many instances to supplement the second German edition and to revise some parts completely. In addition to piezo-electric methods, others are now also extensively discussed in Chapter 8. As for the intensity method, ultrasonic holography is treated in the new Section 9. 4. In Part B, for reasons of systematics, the resonance method has been included under transit-time methods. It appeared necessary to elaborate in greater detail the definition of the properties of pulse-echo testing equipment and their measurements (10. 4). The more recent findings of pulse spectroscopy (5. 6) and sound-emission analysis (12) are mentioned only in passing because their significance is still controversial. Apart from numerous additions, particularly those concerning automatic testing installations, Part C also contains a new chapter which deals with tests on nuclear reactors (28), as well as a brief discussion of surface-hardness tests (32. 4). It became impossible to include a critical analysis of the principal standards in Chapter 33.

This book was proposed and organized as a means to present recent developments in the field of nondestructive testing of materials in civil engineering. For this reason, the articles highlighted in this editorial relate to different aspects of nondestructive testing of different materials in civil engineering—from building materials to building structures. The current trend in the development of nondestructive testing of materials in civil engineering is mainly concerned with the detection of flaws and defects in concrete elements and structures, and acoustic methods predominate in this field. As in medicine, the trend is towards designing test equipment that allows one to obtain a picture of the inside of the tested element and materials. From this point of view, interesting results with significance for building practices have been obtained
