A large fraction of the volume is devoted to the current state of the  
art in M-theory, in particular its underlying superalgebra as well as  
its connection with superstring and  $N = 2$  strings. The physics of D-  
branes and its essential role in the beautiful computation of the  
black hole entropy is also carefully covered.

Strings, Branes and Dualities in SearchWorks catalog  
Strings, Branes and Gravity. Many of the topics in this book are outgrowths of the spectacular new understanding of duality in string theory which emerged around 1995. They include the AdS/CFT correspondence and its relation to holography, the matrix theory formulation of M theory, the structure of black holes in string theory, the structure of D-branes and M-branes, and detailed development of dualities with  $N = 1$  and  $N = 2$  supersymmetry.

In string theory, D-branes, short for Dirichlet membrane, are a class of extended objects upon which open strings can end with Dirichlet boundary conditions, after which they are named. D-branes were discovered by Dai, Leigh and Polchinski, and independently by Hořava, in 1989. In 1995, Polchinski identified D-branes with black p-brane solutions of supergravity, a discovery that triggered the Second Superstring Revolution and led to both holographic and M-theory dualities. D-branes are ...
